SLIDEPIX

Build slides where you build everything else

A visual editor for VS Code and Cursor—with Markdown, x^2, media, motion, presenter view, and deterministic export.

One file. Full control.

Markdown text and display math:

$$E = mc^2$$

```
const deck = open("demo.slidepix.json");
deck.present();
```

Human-readable

- visual editing
- stable JSON
- relative assets
- clean diffs

The canvas and the file stay in sync.

Media that behaves like design

Border + corner radius

Crop + four-edge fade

Motion without rebuilding the slide

Duplicate, move, present

A shared `morphKey` connects objects across slides. No timeline authoring is required for the movement itself.

Motion without rebuilding the slide

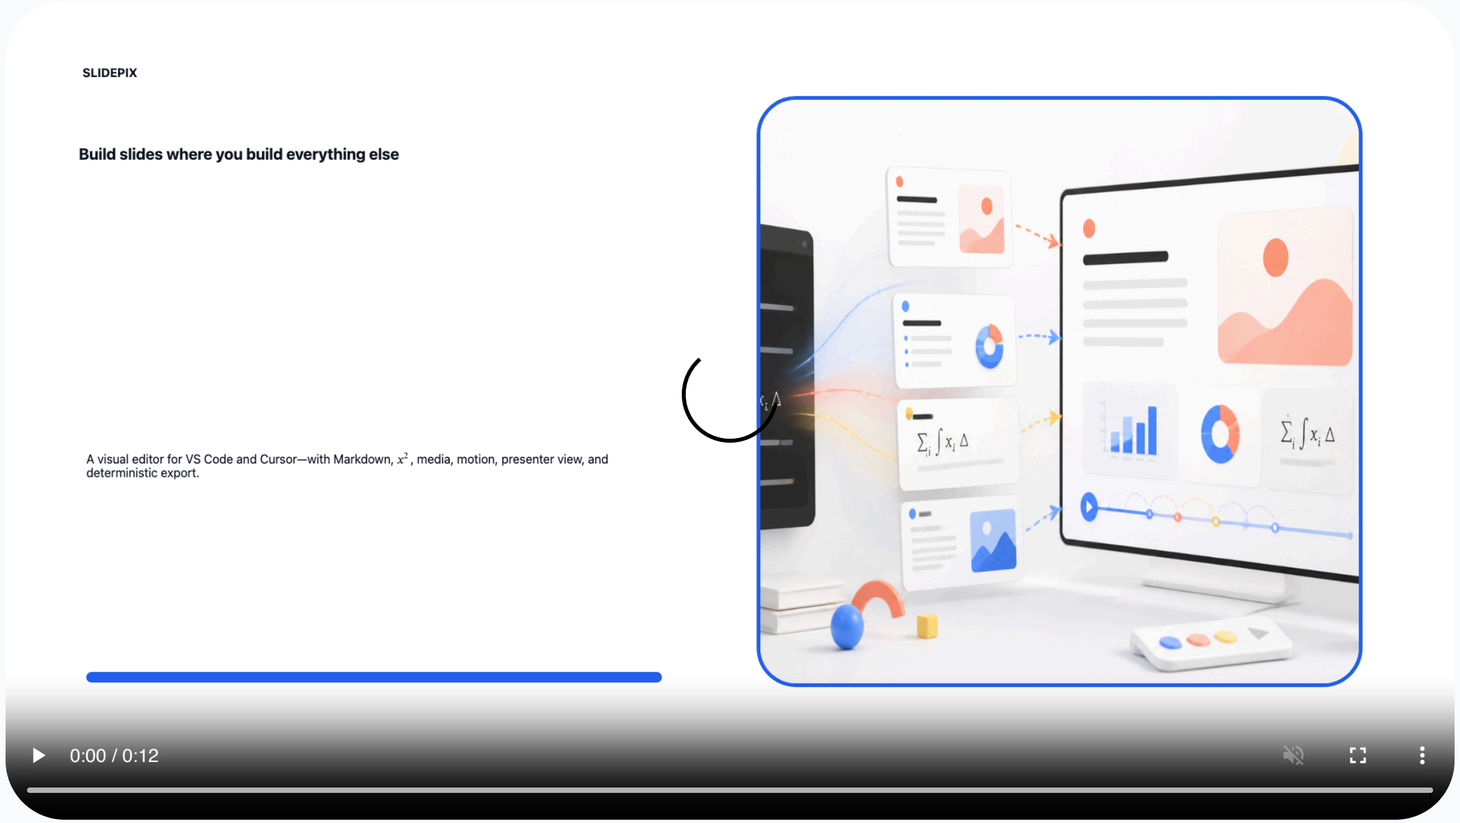

The same objects, transformed

Position · size · rotation · opacity · radius · crop

Unmatched objects crossfade naturally.

Present. Export. Share.

One deck, every output

- fullscreen audience
- presenter notes
- PDF and PNG
- read-only MCP review
